**Five Lab Conference**  
**Vienna, Austria**  
**June 19-23, 2005**

**SAND 2005-3222C**

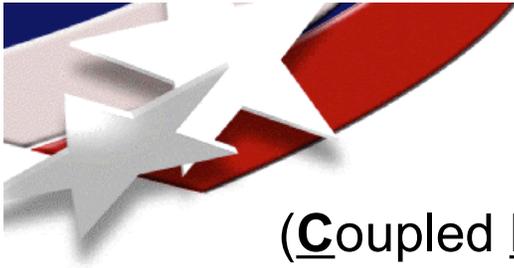

Sandia is a multiprogram laboratory operated by Sandia Corporation, a Lockheed Martin  
Company,  
for the United States Department of Energy's National Nuclear Security Administration under  
contract DE-AC04-94AL85000.

# Outline

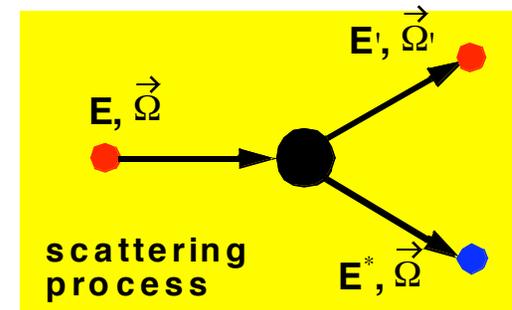

- Overview of CEPTRE
- Introduction to Cable SGEMP Simulations
- CEPTRE Numerical Difficulties
- CEPTRE Strategies for Speed-Up
- Results for RG402 Simulation
- Summary

# CEPTRE Code

(Coupled Electron Photon Transport for Radiation Effects)

- Time-independent, deterministic, coupled electron-photon transport code on unstructured mesh
- Numerical solutions to the Boltzmann transport equation which describes the particle distribution in phase space ( $r, E, \Omega$ )
- Physics of particle-media interactions properly characterized by cross sections
- Discretization of Phase Space
  - *Multigroup* approximation in energy along with Legendre expansion of scattering cross sections
  - *Discrete-Ordinates* approximation in direction
  - *Finite-Element* approximation in space

# CEPTRE Features

---

- Multigroup energy discretization
- Discrete ordinates angular discretization
- Arbitrary order of anisotropic scattering
- Unstructured-mesh Galerkin finite elements
- Second-order forms of the transport equation
  - **Self-Adjoint Angular Flux (SAAF)**
  - **Even-Odd Parity Flux (EOPF)**
- Parallel implementation with spatial domain decomposition
- Object-oriented program design with C++
- Integrated into an architectural framework (Nevada)
- Build on parallel Krylov solver libraries (Trilinos, AztecOO)
- Simultaneous space-direction solve

## Properties of Second-Order Form

---

$$\left[ -\hat{\Omega} \cdot \nabla \mathfrak{R}^{-1} \hat{\Omega} \cdot \nabla + \mathfrak{R} \right] \psi(\vec{r}, \hat{\Omega}) = Q(\vec{r}, \hat{\Omega}) - \hat{\Omega} \cdot \nabla \left[ \mathfrak{R}^{-1} Q(\vec{r}, \hat{\Omega}) \right]$$

- Transport operator on left is self-adjoint
- Removal operator is an effective cross section – inverse appears
- Scattering included in transport operator
- Right side is fixed within an energy group

# CEPTRE Employs a Unique Solution Strategy

---

- Slow convergence rate for electron transport
- Low parallel efficiency due to coupling in directions from scattering

## Conventional Source Iteration

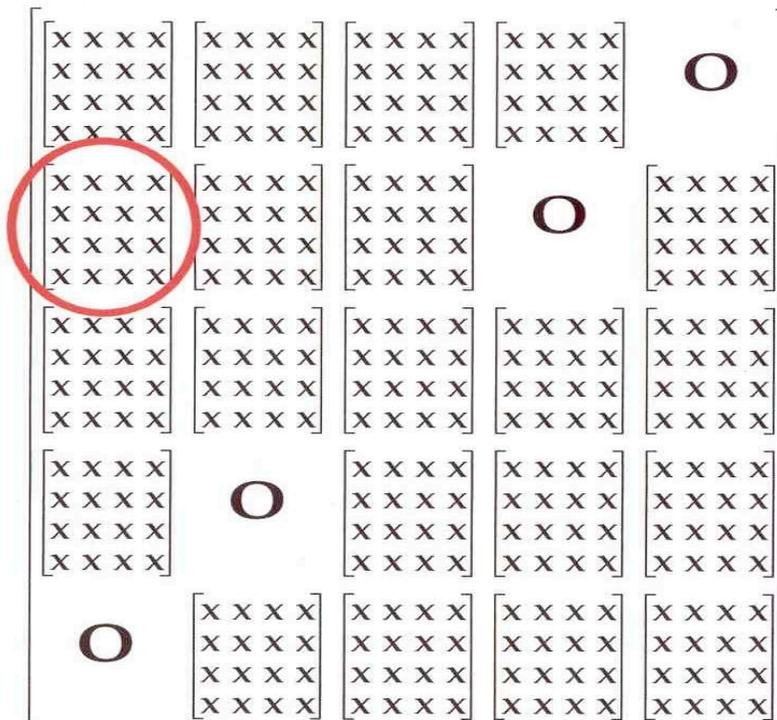

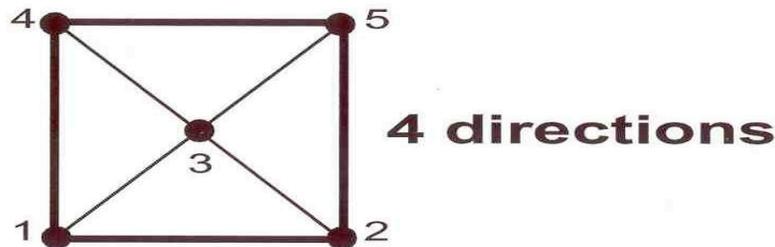

- 
- Fast convergence rate for electron transport
  - Good parallel efficiency
  - Large storage requirement

## CEPTRE

# Simultaneous Space-Direction Solution Algorithm

- Sparse block matrix
- Symmetric Positive Definite System
- Number of block rows:
  - $N_{\text{nodes}}$
- Block size
  - $N_{\text{directions}} \times N_{\text{directions}}$
- Blocks are full due to coupling from scattering
- Tailor-made for VBR data format
- Storage  $\sim (N_{\text{directions}})^2 \times N_{\text{nodes}}$
- Run time  $\sim (N_{\text{directions}})^2 \times (N_{\text{nodes}})^{1.5}$

# Parallel Iterative Algorithm

---

- Preconditioned Conjugate-Gradient method with domain decomposition
- Extensive use of existing parallel iterative-solution libraries (Trilinos, AztecOO)
- Fast convergence rate for electrons
- Slow convergence rate for photons on FE meshes with refined cells (90% of run time)

# Cable SGEMP Analysis

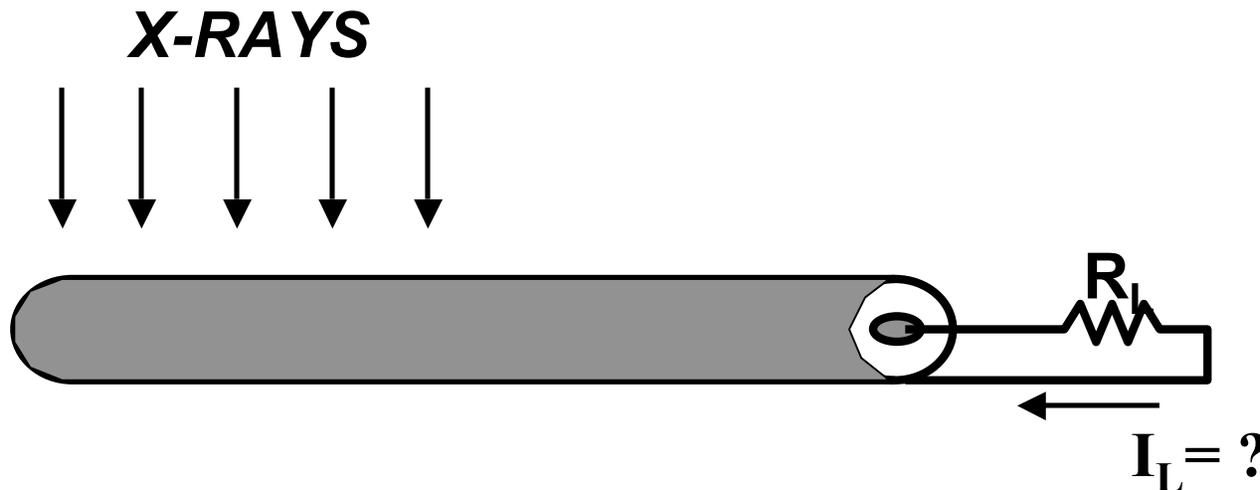

---

- Will electronics be disrupted/damaged by an incident x-ray source that will cause photo/Compton-emission electrons from material surfaces and energy and charge deposition within its materials?
- Generates electrical fields on cable shields and conductors within cables, a phenomenon referred to as cable System Generated Electromagnetic Pulse (SGEMP)

# Cable SGEMP Simulation Process

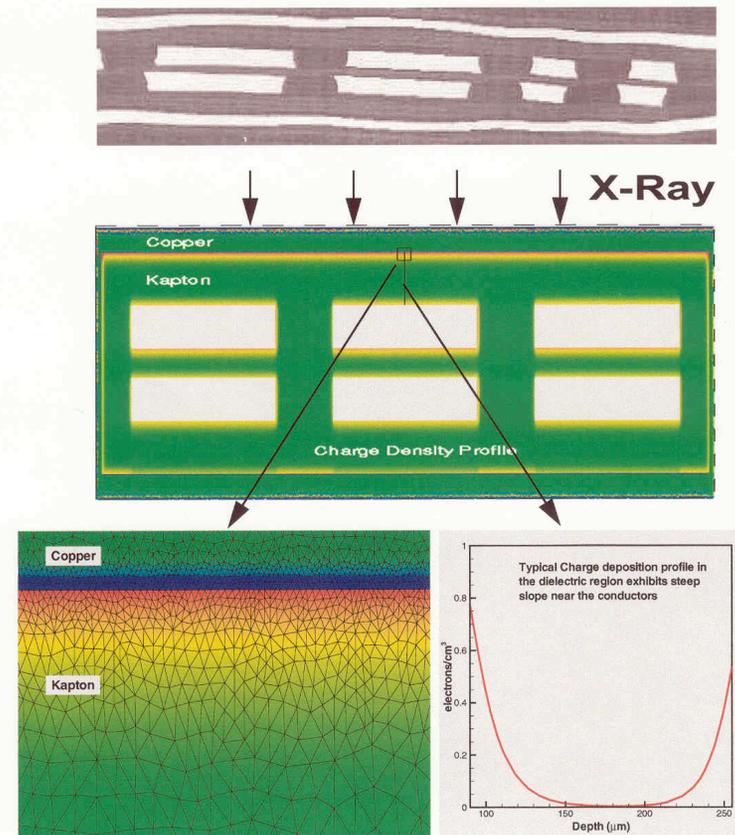

- Computational capability developed for cable SGEMP simulations consists of two distinct calculations:
  - CEPTRE performs radiation transport simulation
  - CABANA performs electrical response simulation
- CEPTRE provides energy deposition, current and charge profiles induced by radiation to CABANA

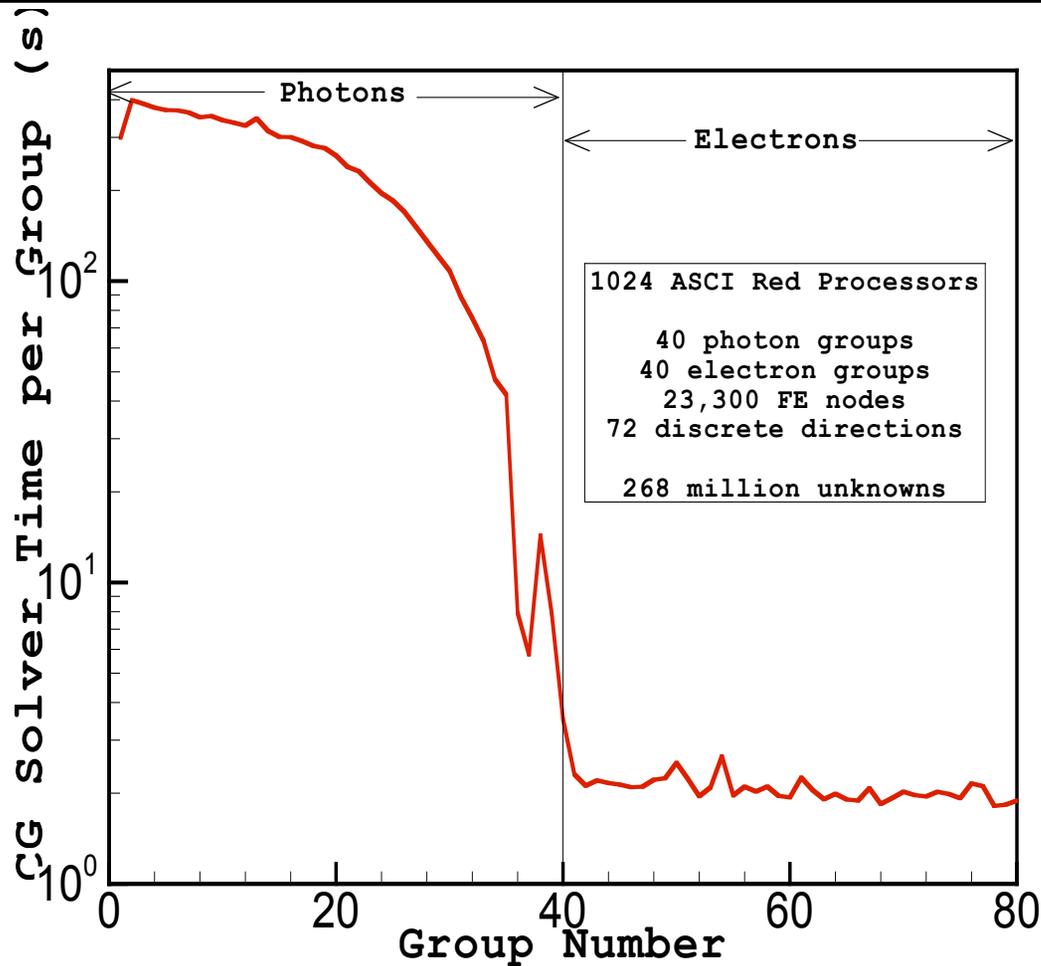

# Cable SGEMP Simulation Needs

- Requires accurate resolution of dose-enhancement and charge profiles near conductor/dielectric interfaces
  - Results in extremely small mesh cells near the material interfaces
  - Use of higher-order finite elements
  - Ill-conditioned matrix for photon-transport

# CEPTRE Numerical Difficulties

- Small mesh nearly transparent to photons
- Matrix extremely ill conditioned
- Slow CG convergence
- Effective preconditioning essential

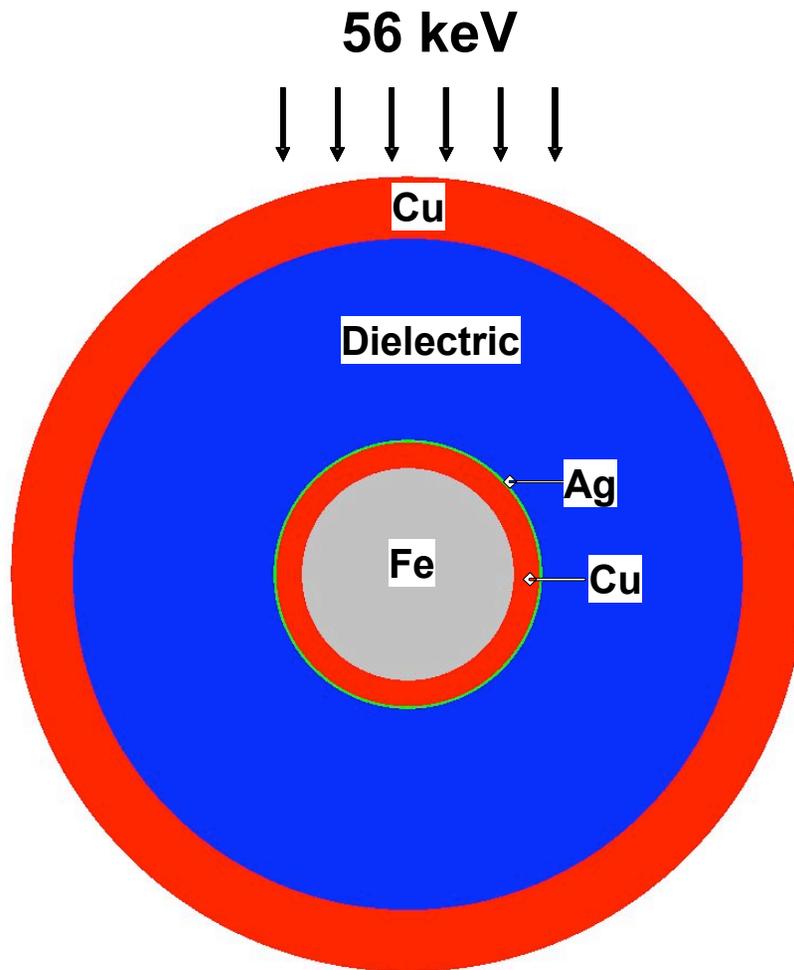

# CEPTRE Speed-Up Strategies

---

- Solve photons on linear FEM and electrons on quadratic FEM (different mean free paths/ranges)
- Lower order quadrature and Legendre expansion of cross-sections for photons (scattering is more isotropic than electrons)
- Employ a block diagonal preconditioner
- Employ 1<sup>st</sup> order Sn transport for photons
- Will speed-up cost accuracy?
  - In radiation transport (knock-on charge at conductor/dielectric interfaces)
  - In electrical response (final load charge)

# Consider the RG402 Coaxial Cable

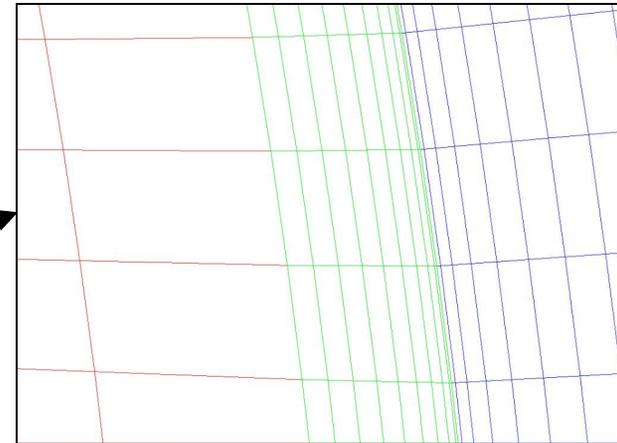

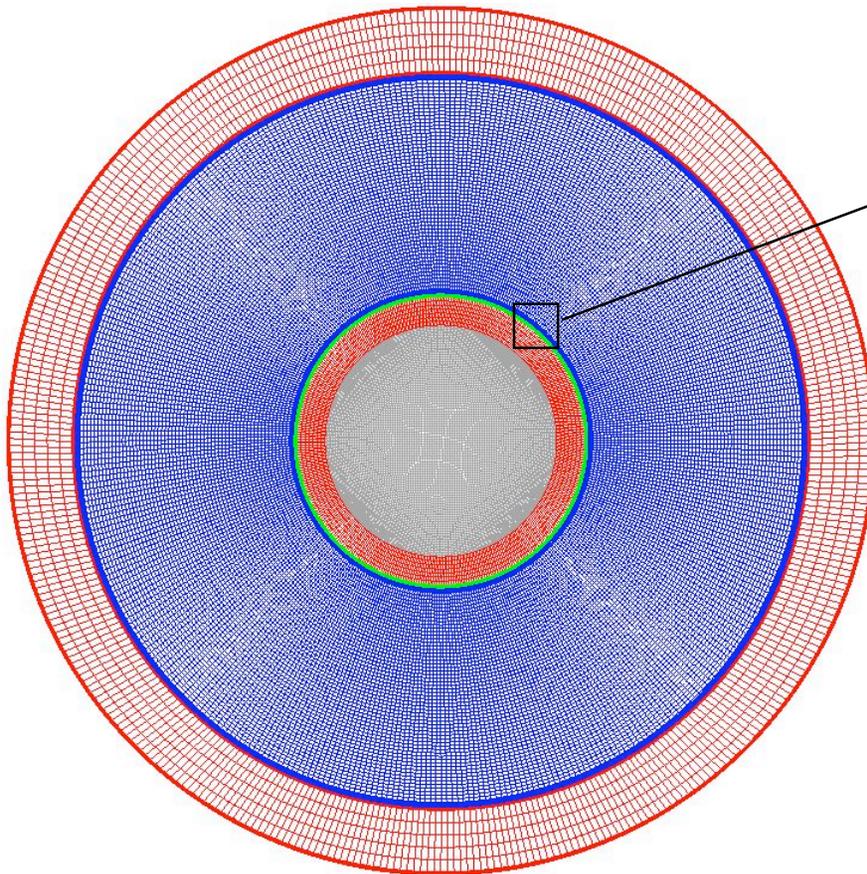

- Average Energy of the Incident Spectra is 56 keV
- S8 Quadrature
- P5 Legendre Expansion of Scattering Cross-Sections

Material	Outer Radius (cm)
Steel	0.04780
Copper	0.05940
Silver	0.06060
Dielectric	0.15113
Copper	0.17907

# Refined RG402 Mesh

- 52,569 Quad8 elements and 158,104 nodes
- S8 problem has  $\approx 3.16$  million unknowns
- Shown to be converged for CEPTRE calculations
- Finest layer of cells  $\approx 0.18$   $\mu\text{m}$  thick

# Speed-Up of Photon Solve

- 32 processors on ICC
- Electron Solve Employs S8, P5 Legendre Expansion on quadratic FEM

Photon Sn / PL	Q knock-off (electrons/cm)	SGEMP (nC/cm)	Photon Solver Time (hrs)	Photon Finite Element Mesh Type
S8 / P5	3.39e-04	6.57e-17	65.75	QUADRATIC
S8 / P5	3.47e-04	8.14e-17	5.21	LINEAR
S8 / P3	3.04e-04	8.25e-17	5.33	LINEAR
S4 / P3	3.04e-04	8.07e-17	0.88	LINEAR

Accuracy and Speed-Up compared with S8, P5 Photon Solve on Quadratic Mesh:

<u>Sn/PL</u>	<u>Ceptre Results</u>	<u>SGEMP Response</u>	<u>Speed-Up</u>
S8/P5	2.3 %	24 %	12.6
S8/P3	10.3 %	26 %	12.3
S4/P3	10.3 %	23 %	74.7

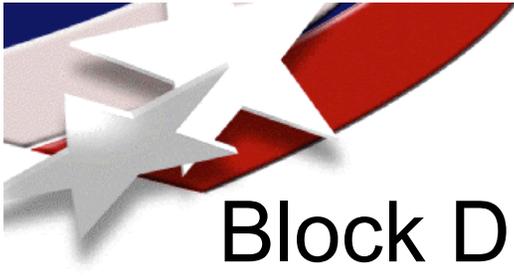

# Block Diagonal Preconditioner

Preconditioned linear system  $M^{-1}Ax=M^{-1}b$

$M =$

- Transport equation *without* scattering
- Sparse-block structure
- Number of block rows:
  - $N_{\text{nodes}}$
- Block size:
  - $N_{\text{directions}} \times N_{\text{directions}}$
  - Diagonal blocks
- Directions decoupled
- Symmetric
- Much easier to solve than original transport equation

# Block Diagonal Preconditioner Speed-Up

---

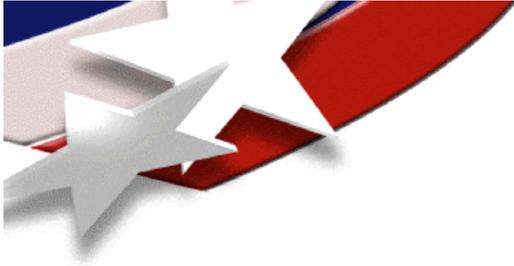

- Outside of Nevada framework and using a special modified version of Aztec the block diagonal preconditioner has shown speed-ups on the RG402:
  - S8 speed-up of 4.3 observed
  - S16 speed-up of 8.0 observed
  - 80 ASCI-Red Processors
- We are in the process of implementing this preconditioner in the Nevada Framework version of Ceptre which uses Trilinos and AztecOO
- Using the preconditioner should not affect a cable's electrical response

# First Order Sn Transport for Photons

---

- First order Sn transport of photons is efficient
  - Parallel multidimensional implementation is complex due to introduction of cycles in “sweeps”
  - Development is underway to implement this using new techniques to handle these parallel sweeps
- Allow solution of photons on same FE mesh as electrons
- Coupled with second order Sn transport of electrons

# Summary

---

- Cable SGEMP analysis requires very accurate resolution of dose-enhancement and charge at material interfaces
- Refined mesh necessary to meet this criterion makes the photon transport with the 2<sup>nd</sup> order form very expensive
- Speed-up can be obtained with minimal effect on radiation transport results
- Electrical response of a cable is very sensitive in radiation transport results
  - Change of 2.3% in radiation transport yields change of 30% in cable response
- Future work is very promising for reducing CEPTRE run-times
