

v3.2a Installation Tip

v3.2 assigned Attractiveness of M to containers with items containing multiple attractiveness levels

v3.2a attempts to alleviate this constraint by providing 2 additional options (using the ConAttracReport global parameter)

Select 'M', the default, and nothing happens but setting the global parameter – works just like v3.2

Select 'H' or 'D' and LANMAS will recalculate the category and attractiveness of containers and post a transaction of the first day of the accounting period (much like it did in the upgrade to v3.2) using the global parameter setting

v3.2a Installation Tip

Container 1 (Calced Category = II)

Item 1 Attractiveness B Calc Category IV

Item 2 Attractiveness C Calc Category IV

Item 3 Attractiveness D Calc Category II

The container will be assigned the following attractiveness based on the global:

- Global parameter 'H' (Highest)
 - Attractiveness B

- Global parameter 'D' (Driver)
 - Attractiveness D

- Global parameter 'M' (Multiple)
 - Attractiveness M
