## **Capabilities Statement**

Orbital ATK operates explosives manufacturing facilities with chemical processes and an industrial setting closely aligned to those at the DOE facilities. We have demonstrated a world-class safety and quality operating culture in extremely high-hazard environments through effective application of proven management processes and an engaged workforce producing weapons delivery systems for the DoD (including propulsion systems for the D5 and Minute Man III ICBMs).

We have established a key role in DOE operations as an integral part of the Consolidated Nuclear Security (CNS) organization currently managing the Y-12 and Pantex facilities. We have a demonstrated track record in operations turnarounds that have occurred as a part of corporate mergers and acquisitions, as well as in key government projects such as the Pantex/Y-12 contract; operation of major Department of Defense (DoD) facilities at Radford, VA, and Lake City, MO; and the modernization of the Australian Mulwala Munitions Facility. We also operate large scale energetic testing (>1.5M lbs per test) at our Promontory, UT test range.

Orbital ATK authorizes NNSA to publicize company/organization name, capability statement, and contact information for possible teaming and subcontracting opportunities.
